

Swadeshi Kitchen

COMPLETE PROJECT HANDOVER DOCUMENTATION

This handbook contains the finalized Implementation Plan, the completed Task Checklist, and the Delivery Walkthrough for the Swadeshi Kitchen cloud kitchen application.

Generated: July 12, 2026

1. Full Implementation Plan

This plan details the technical phases executed to convert the Swadeshi Kitchen prototype into a premium, production-ready web application.

Phase 1: Core Architecture & Routing

Established a Single Page Application (SPA) structure supporting the customer-facing interface and administrative backend on a unified build.

- Implemented client-side routing using **HashRouter** to resolve 404 file errors when reloading subpages on GitHub Pages.
- Created a custom **404.html Redirect Interceptor** in the public assets directory to catch standard URL paths and reroute them safely on the client side.

Phase 2: Shared Storage Layer & Failover

Designed a unified state management script to sync configurations dynamically across views.

- Configured local storage adapters with fallback values matching the business email, address, and WhatsApp contact number.
- Added a database self-healing check to correct old cache structures automatically inside customer browsers.
- Wired Firebase database handlers to support cloud operations.

Phase 3: UI Redesign & Mobile Optimization

Overhauled the interface to achieve a modern, responsive layout across all device viewports.

- Structured a flexbox card design that locks buttons symmetrically to the bottom of all cards.
- Created scroll-triggered fade-in animations on all HTML sections.
- Added a mobile-specific drawer navigation and a sticky bottom quick-action bar.

Phase 4: WhatsApp checkout & Live tracking

Integrated order dispatch pipelines and a background polling progress slider.

- Designed a POS-formatted text receipt template to deliver orders to the kitchen without corrupt emojis.
- Implemented a background interval hook that polls the database every 3 seconds to update the active tracking slider instantly.

2. Finished Task Checklist

The checklist of all tasks verified and completed during development:

Architecture & Routing

- ✓ Set up Vite + React + TypeScript bundler environment. **DONE**
- ✓ Switch to HashRouter in App.tsx for static pages routing safety. **DONE**
- ✓ Create 404.html redirect script in public directory. **DONE**

Database & States

- ✓ Create storage schemas and fallbacks in store.ts. **DONE**
- ✓ Add local storage cache migration scripts. **DONE**
- ✓ Configure Firebase Firestore connectors for cloud syncing. **DONE**

UI redesign

- ✓ Align "Add to cart" buttons symmetrically across the grid. **DONE**
- ✓ Add centered header navigation and desktop CTAs. **DONE**
- ✓ Build Framer Motion mobile drawer and bottom menu. **DONE**
- ✓ Add scroll-triggered slide-in animations. **DONE**

Checkout & Tracking

- ✓ Format checkout messages as emoji-free POS receipts. **DONE**
- ✓ Integrate 3-second live tracking background polling. **DONE**
- ✓ Add "Packed" status to both Admin and Customer views. **DONE**

3. Final Delivery Walkthrough

Overview of the live features and systems running on the production build:

A. Mobile & Desktop Visuals

The frontend is fully optimized. The header, hero image grids, dynamic category filters, and product lists adapt fluidly from desktops down to handheld screens. Elements rise into view dynamically as the user scrolls, providing a highly premium look and feel.

B. Dynamic Timing & Settings Sync

Admin panel updates to opening hours, contact details, banner images, and meta descriptions are saved instantly to the database. The customer homepage reads these settings dynamically, maintaining 100% operational synchronicity without requiring code changes.

C. Live Order Tracking

Placed orders appear immediately inside the Admin Orders panel. Setting the order status to Pending, Preparing, Packed, Out for Delivery, or Delivered instantly updates the customer's visual progress tracker via background client-side polling.

D. Deployment Branch Details

The code is deployed live on GitHub Pages under the new repository base. All routing redirects and files are active.
